QUAD 2-INPUT MULTIPLEXER

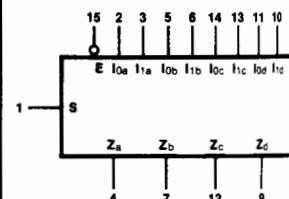

DESCRIPTION — The '157 is a high speed quad 2-input multiplexer. Four bits of data from two sources can be selected using the common Select and Enable inputs. The four buffered outputs present the selected data in the true (non-inverted) form. The '157 can also be used to generate any four of the 16 different functions to two variables.

FUNCTIONAL DESCRIPTION — The '157 is a quad 2-input multiplexer. It selects four bits of data from two sources under the control of a common Select input (S). The Enable input (\bar{E}) is active LOW. When \bar{E} is HIGH, all of the outputs (Z) are forced LOW regardless of all other inputs. The '157 is the logic implementation of a 4-pole, 2-position switch where the position of the switch is determined by the logic levels supplied to the Select input. The logic equations for the outputs are shown below:

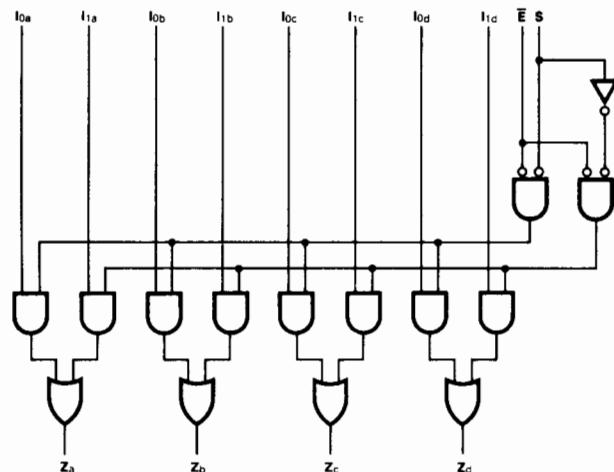

$$\begin{aligned} Z_a &= \bar{E} \cdot (I_{1a} \cdot S + I_{0a} \cdot \bar{S}) & Z_b &= \bar{E} \cdot (I_{1b} \cdot S + I_{0b} \cdot \bar{S}) \\ Z_c &= \bar{E} \cdot (I_{1c} \cdot S + I_{0c} \cdot \bar{S}) & Z_d &= \bar{E} \cdot (I_{1d} \cdot S + I_{0d} \cdot \bar{S}) \end{aligned}$$

A common use of the '157 is the moving of data from two groups of registers to four common output busses. The particular register from which the data comes is determined by the state of the Select input. A less obvious use is as a function generator. The '157 can generate any four of the 16 different functions of two variables with one variable common. This is useful for implementing highly irregular logic.
